

Statutes (statrefs.dtx)

Charles Duan

January 13, 2025

1 Short Statute Names

Many types of references will use the following convention for statute names. The following inputs are relevant, with syntax as follows:

Key Parameters:

name: The full, unabbreviated name of the statute or document. The word “The” should not be included at the beginning; it is assumed that the full name would be recited with “The” in ordinary speech.

inline: The short, abbreviated name of the statute or document. Because some abbreviated names include “the” at the beginning and others do not (compare “the FFDCA” with “HIPAA”), it is necessary to specify the form. For references that use “the” before the short name, include it in this parameter.

For both the full and short forms, the package will automatically prepend “the” or “The” at the beginning of the name depending on citation context, particularly when `\Inline` or `\adjective` are used (see `iface.dtx`).

If no short name is given, then one is automatically constructed that is identical to the full name, except any year specification will be removed (e.g., “Communications Act of 1930” would be shortened to “Communications Act”). The word “the” is implicitly added to the start of the constructed short name as well.

#1 is the reference name of the citation.

```
\def\hi@inlinestatname#1{%

}

```

statcode: A statute in a code

Key Parameters:

vol, rep: The volume number and title of the statutory code.

page: The section or other subdivision number of the statute in the code.

Optional Parameters:

name, inline: The full and short names for this reference, as described with regard to statute names in `statrefs.dtx`.

origsect: If the statute has a section number different from its codification section number, that original section number may be included here.

year: The year of publication of the code containing the statute.

Any book publication parameters described in `bookrefs.dtx` are also permitted.

Pin cites given in citation items will use the pin cite joining algorithm given in `pages.dtx`.

Example:

```
\defstatcode{15-usc-1}{
  cite=15 U.S.C. S 1,
}
```

Produces:

15 U.S.C. § 1.

The `\defcitegroupcommand` is especially useful in combination with `\defstatcode`; see `refs.dtx` for examples.

Example:

```
\defstatcode{337}{
  name=Tariff Act of 1930,
  origsect=S 337,
  cite=19 U.S.C. S 1337,
  paren=as amended,
}
```

Produces:

Tariff Act of 1930 § 337, 19 U.S.C. § 1337 (as amended).

This demonstrates a statute that has been codified with a section number different from its session law section, where the session law section number is still commonly used.

regcode: A regulation in a code

This only differs from `statcode` in the `toacat` being regulation rather than statute. The parameters and features are the same as those for `statcode`.

```

```

Insertable into citation body, to define `\hi@statcode@shortname` as the short name form for a statutory citation (for title matching and display purposes).

XXX TODO: There is a major problem with this right now. `fc@[statcode]` uses `[vol]/[rep]` as the format for `\@this@title`, but the short-forms use a formatted text, meaning that they don't match up. But I'm also not sure why this `makeshortname` macro exists: It seems to set `\@this@title` based on irrelevant user-provided parameters from `\hi@statcode@choosename`. The better approach would be (1) to define a

consistent standard for `\@this@title` used across the full and short citation forms; and (2) to define a better standard for using the optional parameters to control the names. Probably the best approach is to say that (1) user parameters control, and in the absence of them we rely on `\@last@title--\@this@title` matching; (2) there should be three user parameters (“title” is used sometimes to mean the textual statute title and sometimes to mean the U.S. Code title number); and (3) there should be some user control over whether id. is displayed for matching titles; id. should rely on title matching and not reference name matching.

```
\def\hi@statcode@makeshortname#1{%
  \hi@ifset\hi@kv@inline{%
    \noexpand\hi@statcode@choosename\noexpand\hi@statcode@shortname
    {%
      \capnext\hi@kv@inline
      \hi@short@use{#1}%
    }\hi@statcode@vlandrep}%
  }{%
    \def\noexpand\hi@statcode@shortname{\hi@statcode@vlandrep}%
  }%
}
```

Chooses a title to use for this citation based on the option parameters. `<#1>` is the macro to define, `<#2>` is the value if “t” is set, `<#3>` is the value if “v” is set. If neither is set, defaults to “t”.

```
\DeclareRobustCommand\hi@statcode@choosename[3]{%
  \hi@ifinopt{t}{t}{%
    \hi@ifinopt{v}{t}{\def#1{#2, #3}}{\def#1{#2}}%
  }{%
    \hi@ifinopt{v}{t}{\def#1{#3}}{\def#1{#2}}%
  }%
}
\make@find@in{v}
```

Produces the statute name in the full citation forms. This macro is expanded within the `fc@[name]` definition.

```
\def\hi@statcode@fmtname{%
  \hi@ifset\hi@kv@name{%
    \hi@name@only{%
      \capnext\hi@kv@name

      }{%
        ,\noexpand\if@hi@in@toa \hfil\break
        \noexpand\else \space \noexpand\fi
      }%
    }%
  }%
}
```

In a full citation for a statute, decide whether or not to display the volume and title information. There are two options:

- If the statute has no name, then show the title based on `\@last@title` (using `\hi@if@title`) as usual. - If the statute has a name, then always show the volume and title information if the name is being shown. If the name is being suppressed (with `\@hi@name@false`), then use `\hi@if@title` as usual. - In all cases, `\@this@title` gets set.

`<#1>` is the `\@this@title` information, `<#2>` is what to do if the title is to be suppressed; `<#3>` is what to do if the title is to be shown.

```
\def\hi@statcode@full@title#1#2#3{%
  \hi@ifset\hi@kv@name{%
    \noexpand\if@hi@name
      #3%

statsess: A statute in session laws

Key Parameters:

- type**: The name to be prefixed to the statute’s serial number. By default this is “Pub. L. No.”
- number**: The serial number of the statute, which should conform to the value expected for **type**.
- vol**, **rep**, **page**, **cite**: Citation locator information for the statute in a session law compilation such as the *Statutes at Large*. This will be used unaltered and should be entered abbreviated.
- year**: The date of enactment of the statute.

Optional Parameters:

- name**, **inline**: The full and short names for this reference, as described with regard to statute names in `statrefs.dtx`. If no name is given, one will be constructed out of the date (which should be a full date as a result).
- chapter**: This sets **type** to “ch.” and then sets **number** to the parameter value.
- in**: For session laws contained within another larger session law (e.g., a part of an omnibus budget act), it may be necessary to cite both session laws to identify the contained one. This parameter can be given the reference name of the larger session law to effect this citation form.
- slip**: For slip laws not yet included in a compilation, use this flag.
- place**: The place of publication (e.g., the state).
- publisher**: The publisher of the statute, if relevant.

Example:

```

\defstatsess{nttaa}{
  name=National Technology Transfer and
  Advancement Act of 1995,
  inline=NTTAA,
  publiclaw=104-113,
  cite=110 Stat. 775
}
\sentence{nttaa at S 12/d1 ::stat: 783}.

```

Produces:

National Technology Transfer and Advancement Act of 1995 (NTTAA), Pub. L. No. 104-113, § 12(d)(1), 110 STAT. 775, 783.

Note how a pin cite to a session law must include not only the section number, but also the Statutes at Large page number following a ::stat: segment marker. See pages.dtx for more on segments in pin cites.

stattitle: A titled statutory citation

This is for statutes that, having been amended many times, are treated like codifications based on their original section numbers. The Communications Act of 1930, the Public Health Service Act, and the Smoot–Hawley Tariff Act are examples of statutes with well-known section numbers that do not correspond to their codifications; a parallel cite to the U.S. Code is required and provided in a struct that maps original section numbers to U.S.C. citations.

This reference type should supersede **statcode** with **origsect**.

The scope of the reference item here is the whole statute, not just an individual section therein. To cite to a section of the statute, the section number is given as the pin cite information. The reference aliasing system described for **alias** can assist in simplifying references to these statutes if a particular section number is repeatedly used.

Key Parameters:

name, **inline**: The full and short names for this reference, as described with regard to statute names in `statrefs.dtx`. Here the name is mandatory, since section numbers correspond to the statute number with that name.

vol, **rep**, **page**, **cite**: The citation locator information for the statute in a codification. Here, **page** should refer to the range of section numbers in the codification that the statute covers. Note that the range will likely never be displayed, if all citations to the statute are to particular sections.

struct: Following the format described in `struct.dtx`, this should be a map of section numbers of the statute to **vol**, **rep**, and **page** values in the codification. The structure is key to ensuring that pin cites display correctly.

Any book publication parameters described in `bookrefs.dtx` are also permitted.

```

\DeclareRobustCommand\hi@stattitle@choppageslash{%
  \expand{\find@in{}}\@this@orig@page i{%
    \@tworun{\def\hi@stattitle@choppedpage}\@gobble
  }
}

```

```
}{\let\hi@stattitle@choppedpage\@this@orig@page}%
}
```

rule: A rule of evidence or procedure

Citations to judicial rules are not especially well-defined, and there are at least two possible approaches for identifying rules (both of which this package supports). First, one could characterize the name of the rule set as a book title and each rule as a named division therein. That would produce output along the following lines:

```
\defrule{frcp12}{rep=Fed. R. Civ. P., page=rule 12}
\sentence{frcp12 at /b6}.
```

Produces:
FED. R. CIV. P. R. 12(b)(6).

The oddity of this form is that “R.” appears twice. To avoid that, it is not enough to remove “rule” from the pin cite (page=12), because then the number looks like a page number that will not accept subdivisions like “(b)(6).” The solution is to use the dash character before the pin cite as described in `pages.dtx`:

```
\defrule{frcp12}{rep=Fed. R. Civ. P., page=-12}
\sentence{frcp12 at /b6}.
```

Produces:
FED. R. CIV. P. 12(b)(6).

The dash forces the pin cite to be interpreted as a “named” division with no name.

Key Parameters:

- rep**: The abbreviated name of the rule set being cited.
- page**: The rule number, see above.

Optional Parameters:

- name**: A name of the rule, if any.
- court**: The court issuing the rule, if not apparent from **rep**.
- year**: The year of promulgation of the rule, if needed.

Pin cites given in citation items will use the pin cite joining algorithm given in `pages.dtx`.
